

AUTISM AWARENESS

Research suggests children with autism spectrum disorders (ASDs) are more likely than non-autistic children to have an auditory processing disorder, which makes it more difficult for them to discern and organize sounds.

Research shows that **18% of children with autism** have hyperacusis.¹

If your child is experiencing symptoms related to sound sensitivity, they may benefit from thorough audiological testing and counseling as well as occupational therapy.

**Call Heard It Through the Grapevine Audiology today at
(817) 488-1637 to schedule an appointment.**
